Sources: CDPH, WHO, CDC, Local County Data, LA Times

The date for which case statistics and hospital data were reported. Hospital COVID data are self-reported through a portal managed by the California Hospital Association and pulled at 2pm. COVID case statistics are reported by local health departments to CaREDIE and are pulled at 2pm. Hospital data and case statistics are integrated by the California Department of Technology and made available through the Open Data Portal the following morning. CA Open Data Portal is at least 24 Hours behind although a backlog of new case reports at the State level has ostensibly been cleared, some County dashboards still contain notes that indicate data are missing. (*Many County sites do not report recovery rates or are only updating once a week)(** based on calculation)(***California Demographics from State Database Blueprint Data Chart 12-15-20 & census.gov)

Covid loses '90pc of its infectiousness within 20 minutes of being airborne'

- Preliminary data from the University of Bristol reveals that in a real world situation the conditions of the air dry out the viral particles. The team measured how stable SARS-CoV-2 droplets – the virus which causes Covid – are over time, ranging from five seconds to 20 minutes.
- “A decrease in infectivity to approximately 10 per cent of the starting value was observable for SARS-CoV-2 over 20 minutes, with a large proportion of the loss occurring within the first 5 minutes after aerosolisation,” the scientists write in the paper.
- The findings indicate that the virus does not survive for long outside the warm and damp environment of a host's respiratory system, and loses its potency rapidly in the wild.
- The study, which has not yet been published in full or peer-reviewed, shows that in air with 50 per cent humidity, akin to that circulated in large buildings, there is a “near-instant loss of infectivity in 50 to 60 per cent of the virus”.
- At much higher humidity, the droplet does not dry out instantly and remains fluid for longer, which means the virus remains stable and infectious for two minutes.
- However, even under these favorable conditions the virus loses 90 per cent of its infectiousness after ten minutes.

When will the UK 'transition from pandemic to endemic' - and how would we learn to live with coronavirus?

- There is hope within government that the UK can be among the first countries worldwide to "transition" from coronavirus being a pandemic to endemic.
- Education Secretary Nadhim Zahawi told Sky's Trevor Philips on Sunday: "I hope we will be one of the first major economies to demonstrate to the world how you transition from pandemic to endemic.
- "And then deal with this however long it remains with us, whether that's five six, seven, 10 years."
- **What does endemic mean?** A virus is endemic when there are "persistent, low or moderate levels of disease" in a given geographical location, according to the Communicable Disease Control Handbook.
- **It becomes an epidemic** when the "occurrence of infection exceeds the expected level for a given time period".
- **The word pandemic refers** to when "an epidemic spreads over several countries or continents". The World Health Organization (WHO) declared coronavirus a pandemic on 11 March 2020 and will also likely announce when it no longer has pandemic status.

Frequent Boosters Spur Warning on Immune Response

- European Union regulators warned that frequent Covid-19 booster shots could adversely affect the immune response and may not be feasible.
- Repeat booster doses every four months could eventually weaken the immune response and tire out people, according to the European Medicines Agency. Instead, countries should leave more time between booster programs and tie them to the onset of the cold season in each hemisphere, following the blueprint set out by influenza vaccination strategies, the agency said.
- The advice comes as some countries consider the possibility of offering people second booster shots in a bid to provide further protection against surging omicron infections. Earlier this month Israel became the first nation to start administering a second booster, or fourth shot, to those over 60. The U.K. has said that boosters are providing good levels of protection and there is no need for a second booster shot at the moment, but will review data as it evolves.
- Boosters “can be done once, or maybe twice, but it’s not something that we can think should be repeated constantly,” Marco Cavaleri, the EMA head of biological health threats and vaccines strategy, said at a press briefing on Tuesday. “We need to think about how we can transition from the current pandemic setting to a more endemic setting.”

SCOTUS strikes down the OSHA ETS

- Thursday afternoon, the U.S. Supreme Court (SCOTUS) released an opinion indicating that larger employers need no longer comply with the OSHA emergency temporary standard (ETS) requiring that employees either 1) get vaccinated, or 2) mask and test weekly. Essentially, this ruling reinstated the stay issued by the Fifth Circuit Court of Appeals several weeks ago, but that was later lifted by the Sixth Circuit Court of Appeals, when numerous challenges to the ETS were consolidated into a multi-jurisdictional lottery.
- The 6th Circuit ruling was appealed to the Supreme Court, who heard arguments Jan. 7, 2022. In the meantime, the rule had temporarily gone into effect (except for testing provisions). However, now, with the SCOTUS ruling the ETS is once again halted.

White House To Make High-Quality Masks Available To All Americans

- President Biden on Thursday said the White House will soon announce a plan to ensure masks are available and free to everyone in the United States. Details should be released next week, Biden said in a tweet.
- The federal government has a stockpile of more than 750 million N95 masks, according to The Associated Press. And though research has shown N95 masks offer better protection, they tend to be more uncomfortable than other options.
- Health officials are not currently altering their guidance to discourage the use of less-protective cloth masks; however, the Centers for Disease Control and Prevention is considering updating its mask guidance to recommend people use N95 or KN95 masks to protect against omicron, according to a Washington Post report.
- When the CDC first issued mask guidance in 2020, it did not recommend the use of N95 masks; however, the recommendation was made to conserve masks for health care workers.

Why do COVID-19 PCR and antigen tests produce different results?

- COVID-19 tests are in greater demand than ever, and new data about the Omicron variant can make picking and using different types of tests confusing. Molecular tests for [COVID-19](#), like the "RT-PCR" technology used by many laboratories — known as PCR tests — are widely considered the "[gold standard](#)" for spotting the most infections caused by SARS-CoV-2.
- By comparison, "antigen" or "lateral flow" tests, which can be done at home and return faster results, are less sensitive than PCR tests, but could be useful for identifying cases when people are likely to be contagious. [One review](#) last year estimated rapid antigen tests might only detect on average 75% of cases that PCR tests can spot, with antigen tests performing best in symptomatic people within the first week of their disease.
- "The appropriate tool in this pandemic is using a rapid antigen test because it only stays positive as long as you are infectious," epidemiologist Dr. Michael Mina, the chief science officer at eMed, [told "CBS Mornings."](#)

RELATED - FDA Warns Against Unauthorized Throat Swabbing for At-Home Rapid Coronavirus Tests

<https://www.usnews.com/news/health-news/articles/2022-01-05/fda-warns-against-unauthorized-throat-swabbing-for-at-home-rapid-coronavirus-tests>

Here's how you can get free home Covid-19 tests

- Starting Saturday, many Americans can get home Covid-19 tests at no cost through their private insurance. They can obtain the tests from pharmacies, retailers and online vendors.
- The program is part of the Biden administration's effort to increase access to testing around the US. It will also distribute free home tests, which will be available to order starting next Wednesday.
- Here's what you need to know about getting free home tests from retailers:
 - Most Americans with private insurance can buy home tests online or in stores and have them paid for at the time of purchase or get reimbursed by submitting a claim to their insurer. So make sure you save your receipts.
 - The tests won't be subject to copays or deductibles.
 - Insurers may set up a network of preferred stores, pharmacies and online retailers where consumers can receive tests at no cost up front. People could still buy tests outside that network, but insurers would only have to reimburse up to \$12 for each one.
 - Consumers should contact their insurers to find out if they provide direct coverage or if claims must be submitted.
 - Insurers must pay for up to eight tests per covered individual per month. So a family of four could get 32 tests each month, for instance.
- Americans can go to a new website, covidtests.gov, to order the tests, starting January 19. Tests are expected to ship within seven to 12 days of being ordered.
- Initially, there will be a limit of four tests per residential household.
- The White House will also set up a hotline for those who cannot order online but has not yet announced a launch date for it.
- Medicare covers at no charge Covid-19 testing done in a lab when ordered by a medical professional.
- Medicaid and the Children's Health Insurance Program, known as CHIP, already cover home tests with no cost-sharing.

Biden announces deployment of military medical teams to states struggling with COVID surge

- President Biden announced the federal deployment of military medical teams to six states to help combat the COVID-19 surge, a White House official told CNN.
- The military teams will support the Cleveland Clinic in Ohio, Coney Island Hospital in Brooklyn, Rhode Island Hospital in Providence, Henry Ford Hospital outside Detroit, University of New Mexico hospital in Albuquerque and University Hospital in Newark, New Jersey, the official said.
- “These teams will be providing relief, triaging patients, helping to decompress overwhelmed emergency departments, and freeing up health care providers to continue other lifesaving care. They will be working alongside health care workers on the front lines to give them the support they need,” the official added.

Study Finds Cannabis Compounds Prevent Infection By Covid-19 Virus

- Compounds in cannabis can prevent infection from the virus that causes Covid-19 by blocking its entry into cells, according to a study published this week by researchers affiliated with Oregon State University. A report on the research, “Cannabinoids Block Cellular Entry of SARS-CoV-2 and the Emerging Variants,” was published online on Monday by the Journal of Natural Products.
- The researchers found that two cannabinoid acids commonly found in hemp varieties of cannabis, cannabigerolic acid, or CBGA, and cannabidiolic acid, also known as CBDA, can bind to the spike protein of SARS-CoV-2, the virus that causes Covid-19. By binding to the spike protein, the compounds can prevent the virus from entering cells and causing infection, potentially offering new avenues to prevent and treat the disease.
- “These cannabinoid acids are abundant in hemp and in many hemp extracts,” van Breemen said, as quoted by local media. “They are not controlled substances like THC, the psychoactive ingredient in marijuana, and have a good safety profile in humans.”
- “Our research showed the hemp compounds were equally effective against variants of SARS-CoV-2, including variant B.1.1.7, which was first detected in the United Kingdom, and variant B.1.351, first detected in South Africa.”

270 Scientists Call On Spotify To Take Action Over "Dangerous" Misinformation On Joe Rogan Podcast

- Nearly 300 scientists and doctors have signed an [open letter to Spotify](#) asking the audio platform to take action against podcaster Joe Rogan, who they say has a "concerning history" of broadcasting misinformation in regard to the COVID-19 pandemic. The letter, first reported by [Rolling Stone](#), focuses on a December 2021 episode of The Joe Rogan Experience featuring guest Dr Robert Malone, who was recently banned from Twitter for violating the platform's COVID-19 misinformation policy. During the episode, Malone made reference to a baseless conspiracy theory that people had been "hypnotized" into believing the prevailing scientific views about COVID.
- The letter says that with Rogan's podcast being the world's largest podcast, Spotify has a responsibility to mitigate any misinformation contained within it. "Mass-misinformation events of this scale have extraordinarily dangerous ramifications," they write. "As scientists, we face backlash and resistance as the public grows to distrust our research and expertise. As educators and science communicators, we are tasked with repairing the public's damaged understanding of science and medicine. As physicians, we bear the arduous weight of a pandemic that has stretched our medical systems to their limits and only stands to be exacerbated by the anti-vaccination sentiment woven into this and other episodes of Rogan's podcast."

Texas teacher accused of locking son in car's trunk to avoid exposure to COVID-19

- A Houston-area teacher allegedly locked her 13-year-old son in the trunk of her moving car as she drove him to a COVID-19 testing site because he had already tested positive and she didn't want to be exposed, authorities say.
- Police issued an arrest warrant for the teacher, 41-year-old Sarah Beam, for felony endangering a child after investigating the incident. Beam had worked for the Cypress-Fairbanks Independent School District in northwest Harris County since 2011.
<https://abc7.com/cy-fair-sarah-beam-cypress-falls-high-school-child-in-trunk-at-covid-testing-site/11438759/>

California allowing COVID-positive health care workers to treat patients

- With the highly infectious omicron variant continuing to surge, California is taking an unprecedented step to try to avoid an overwhelmed health care system: allowing doctors and nurses who test positive for the virus to return to treating patients immediately, so long as they are asymptomatic and masked up.
- The move has drawn pushback from nurses' unions, who staged rallies Thursday at Bay Area hospitals to demand more staffing and safer working conditions. Hospitals have said they will bring in COVID-positive workers only if absolutely necessary, and it appeared Thursday that few if any have taken that drastic step. But that time could come sooner rather than later.
- The roughly 51,000 people in hospital beds across California right now — including about 13,000 with COVID — has swelled to about what it was during last winter's surge and could rise by the end of January to 40% beyond last year's peak, Carmela Coyle, president of the California Hospital Association, said during a call Thursday with reporters.
- Unlike last year, the problem isn't about having enough space and supplies for patients. Instead it's about having enough hospital staff. As even fully vaccinated and boosted health care workers are coming down with the virus. The problem is compounded by the fact that some burned-out health care workers have quit or retired in the last year amid a pandemic that will not let up.

Health Care Workers' Planned Walkout Averted In Riverside County

- A planned walkout involving more than 300 unionized healthcare workers at a west Riverside hospital will not go forward as planned Thursday, following word that a tentative collective bargaining agreement was cinched.
- Service Employees International Union-United Healthcare Workers West had announced Monday that all 334 members working at Doctors Hospital of Riverside would be taking to the picket lines at 6 Thursday morning for a 24-hour strike to raise awareness about problems with staffing, low wages and other issues under negotiation.
- "A big reason we've been so understaffed is that it's hard to get workers to stay here," Doctors Hospital of Riverside Pathology Assistant John Richardson said. "People would come for three to six months, get some experience and move on. Now, with this new agreement, we've got a better chance of keeping experienced caregivers here in Riverside to care for our patients."
https://patch.com/california/temecula/s/i1xcn/health-care-workers-planned-walkout-averted-riverside-county?utm_source=pushly&utm_medium=browser_notifications&utm_campaign=1792061

Newsom deploying National Guard to help staff COVID-19 testing sites

- Gov. Gavin Newsom announced Friday that he is activating the California National Guard to add COVID-19 testing sites and boost capacity. More than 200 guard members are being deployed now - and likely more in the near future - to 50 OptumServe sites to help with clinical staffing and crowd control, the governor said.

Southwest Riverside County Infant Dies From COVID

- An infant from Southwest Riverside County has died after contracting COVID-19, becoming the youngest person in the county to succumb to the virus since the pandemic started, county health officials announced Thursday. The death took place earlier this week at a local hospital where the infant was taken after becoming ill. The name of the child, who was less than 1 year of age, and city of residence were not being released, Riverside University Health System-Public Health announced.
- The previous youngest death in Riverside County was a 4-year-old child from Western Riverside County who died in August.

Saddleback Valley School District Angers Parents by Ending COVID Dashboard During Surge

- Saddleback Valley Unified School District nixed its COVID-19 dashboard because officials can't keep up with the high number of new cases, sparking another flashpoint in Orange County's debate on how to teach children during the Omicron surge.
- "We regret to inform you that we have been unable to maintain accurate up-to-date reporting data," reads the district website. "With a focus on our students, we have been funneling our District Office personnel resources to our school sites so that in-person student learning is not interrupted as we experience isolation periods of school staff members."
- "We will be removing the SVUSD COVID-19 Reporting Dashboard from our website at this time. Transparency and accuracy are values of ours and we do not want to share information that we know is not correct."

79.0M People received a booster dose**	Population ≥ 12 Years of Age		203,545,873	71.8%
	Population ≥ 18 Years of Age		189,779,847	73.5%
	Population ≥ 65 Years of Age		48,198,816	88%

The percent of the population coverage metrics are capped at 95%. Learn how CDC estimates vaccination coverage.

*For surveillance purposes, COVID Data Tracker counts people as being "fully vaccinated" if they received two doses on different days (regardless of time interval) of the two-dose mRNA series or received one dose of a single-dose vaccine.

**The count of people who received a booster dose includes anyone who is fully vaccinated and has received another dose of COVID-19 vaccine since August 13, 2021. This includes people who received booster doses and people who received additional doses.

***The count and percent of people eligible for a booster dose and who have not received a booster or additional dose. Booster eligibility counts and percentages exclude vaccine administrations reported by Texas as the primary series cannot be linked to booster dose in the aggregate data submitted by Texas. Criteria for booster eligibility may change over time; data will be updated, as able, to align with the current recommendations.

Total Vaccine Doses	At Least One Dose	Fully Vaccinated	Booster Doses	Booster Eligible
Delivered 648,764,695 Administered 525,604,449	Fully Vaccinated* People with a Booster Dose**		Count	Percent of Fully Vaccinated*

INITIAL PUBLIC RELEASE // SUBJECT TO CHANGE

VACCINATION RATES BY COUNTY

Percent of Population Fully Vaccinated: 62.8%
Percent of Population with at Least 1 Dose: 74.7%

Percent of Population Initiating Vaccination in the Last Week: 0.7%

Source: Unified COVID-19 Vaccine Dataset. Fully vaccinated indicates those who received the second dose of Pfizer-BioNTech or Moderna vaccines and those who received one dose of J&J/Janssen COVID-19 vaccine. Initiating vaccination indicates those who have received the first dose of the Pfizer-BioNTech or Moderna vaccines and those who have received a dose of the J&J/Janssen vaccine in the last week. Values reflect total by report date, not administered date. In instances where the number of people fully vaccinated is greater than those with at least one dose for a specific county, the county will have "no data" on the map of population initiating vaccination; see COVID Data Tracker for further information. The following states have $\leq 80\%$ completeness reporting vaccinations by county, which may result in underestimates of vaccination data for counties and CBSAs: VT (74%), GA (60%), HI (0%)

Idaho provides vaccine data only for vaccine recipients who are 18 years and older, in line with state laws. COVID-19 vaccination administration data are unavailable for the Idaho population aged less than 18 years.

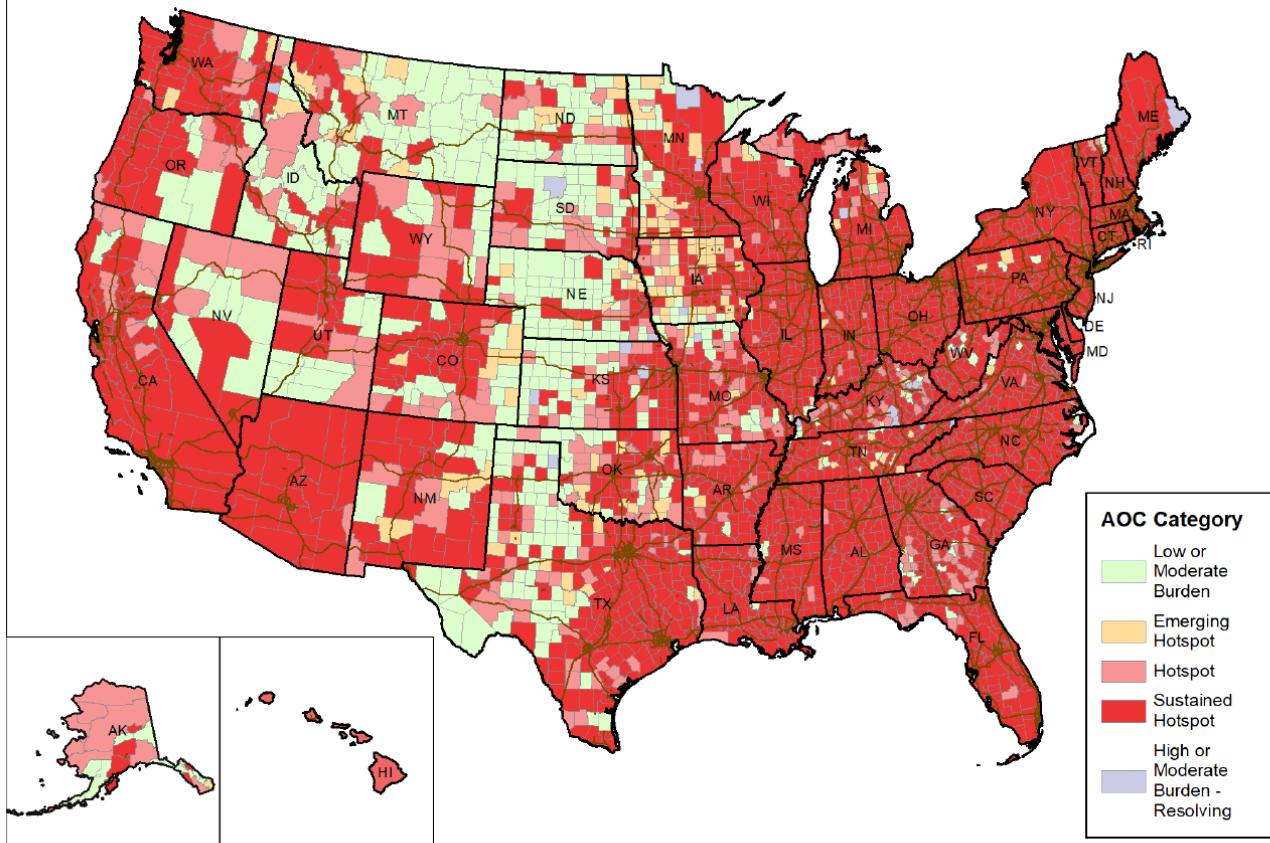

INITIAL PUBLIC RELEASE // SUBJECT TO CHANGE

AREA OF CONCERN CONTINUUM

Date: 1/13/2022

Area of Concern Continuum by County 12JAN2022

The Areas of Concern Continuum (AOCC) is used to describe communities as they progress through stages of the epidemic. There are 7 possible AOC classifications based on current and recent history of case and testing data for the location:

- (1) **Low Burden** – communities with minimal activity
- (2) **Moderate Burden** – communities with moderate disease activity
- (3) **Emerging Hotspot** – communities with a high likelihood to become hotspots in the next 1-7 days
- (4) **Hotspot** – communities that have reached a threshold of disease activity considered as being of high burden
- (5) **Sustained Hotspot** – communities that have had a high sustained case burden and may be higher risk for experiencing healthcare resource limitations
- (6) **High Burden – Resolving** – communities that were recently identified as hotspots and are now improving
- (7) **Moderate Burden – Resolving** – communities that have a moderate level of burden, but are demonstrating improvement

See Data Sources/Methods slides for more information.

CDC Guidance

<https://www.cdc.gov/coronavirus/2019-ncov/communication/guidance-list.html?Sort=Date%3A%3Adesc>

[Operational Considerations for Community Isolation Centers for COVID-19 in Low-Resource Settings](#)

This document describes how to set up a Community Isolation Center for COVID-19 patients who are not able to isolate at home, but may not be ill enough to be hospitalized. This document is to be used in global settings, not in the US. Date: 1/13/22

[Operational Considerations for Adapting a Contact Tracing Program to Respond to the COVID-19 Pandemic in non-US Settings](#)

Contact tracing is a key component of controlling transmission of infectious diseases. This document is for CDC country offices, ministries of health, sub-national public health authorities, and other implementing partners in non-US settings. While select adaptations may be relevant for any jurisdiction, the document focuses on adaptations that might be especially useful in low- and middle-income countries. Date: 1/13/22

[Ending Isolation and Precautions for People with COVID-19: Interim Guidance](#)

Healthcare professionals, find information and recommendations for ending isolation and precautions when caring for people with laboratory-confirmed COVID-19, including children and adults, people who are severely ill, and people who are infected but never develop symptoms. Evidence supports ending isolation and precautions for people with COVID-19 using a symptom-based strategy. Date: 1/13/22

[Operational Considerations for Routine Immunization Services during the COVID-19 pandemic in non-US Settings Focusing on Low- and Middle-Income Countries](#)

Learn COVID-19 operational considerations to implement immunization services in non-US countries with low or middle incomes. Date: 1/13/22

[Contact Tracing for COVID-19](#)

This section provides steps and consideration that jurisdictions can use to develop a protocol for the tracing of close contacts. Date: 1/13/22

[Operational Considerations for the Identification of Healthcare Workers and Inpatients with Suspected COVID-19 in non-U.S. Healthcare Settings](#)

This document is provided by CDC and is intended for use in non-US healthcare settings. This document provides guidance on the identification or screening of healthcare workers and inpatients with suspected COVID-19. Date: 1/13/22

Vaccinations by zip code

This map shows the share of the population that has received COVID-19 vaccine by zip code and the VEM quartiles.

The percentage of those who have received a partial or full series of COVID-19 vaccine out of the total eligible population in each zip code are indicated by gray shading. Darker shades of gray indicate a higher percentage. Lighter shades of gray indicate a lower percentage.

The VEM quartiles are identified by the colors of the circles at the center of each zip code.

Post-Vaccine COVID-19 Cases

<https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/COVID-19/Post-Vaccine-COVID19-Cases.aspx>

What Is a Post-Vaccination COVID-19 Case?

Post-vaccination cases are defined as individuals who are fully vaccinated and have a positive SARS-CoV-2 molecular (e.g. PCR) test 14 days or more after they have completed their full one-dose or two-dose COVID-19 vaccination series. They are also referred to as vaccine breakthrough cases.

How Are Post-Vaccination COVID-19 Cases Identified?

The California Department of Public Health (CDPH) is identifying post-vaccination cases by analyzing the immunization and case registries to find individuals who have a positive SARS-Cov-2 molecular test at least 14 days after they have completed their full vaccination series. Local Health Jurisdictions (LHJs) are also encouraged to alert CDPH of post-vaccination cases especially if they result in severe disease (e.g., hospitalization or death) or if they are associated with an outbreak.

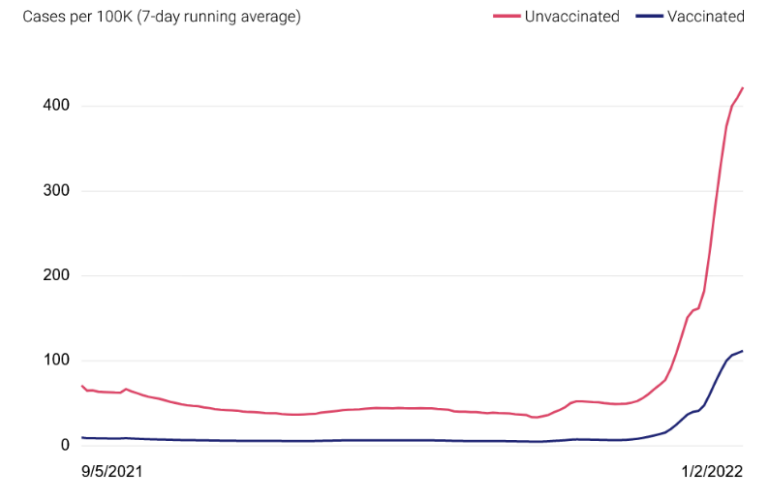

Why are we Tracking Post-Vaccination Cases?

Tracking cases of COVID-19 that occur after vaccination is important for monitoring the immunization campaign. While COVID-19 vaccines are safe and effective, some cases are still expected in persons who have been vaccinated, as no vaccine is 100% effective. If the number or severity of post-vaccination cases exceeds expected levels, this could be a signal of reduced protection against a variant or errors in vaccine delivery. Whole genome sequencing of post-vaccination cases, especially severe cases, can help characterize the effectiveness of current vaccines against variants.

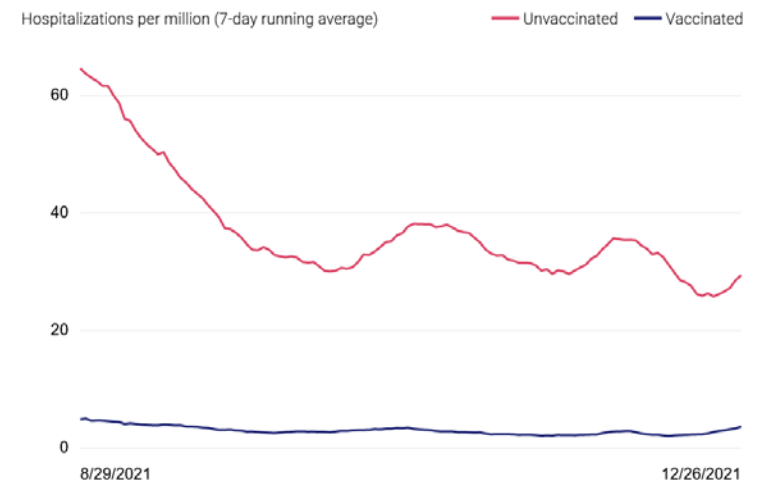

Unvaccinated and vaccinated data

<https://covid19.ca.gov/state-dashboard/#postvax-status>

From December 27, 2021 to January 2, 2022, unvaccinated people were **3.8 times more likely** to get COVID-19 than fully vaccinated people.

From December 20, 2021 to December 26, 2021, unvaccinated people were **8.0 times more likely** to be hospitalized with COVID-19 than fully vaccinated people.

Regional ICU Capacity

Legend

The Air Quality Index (AQI) is an index for reporting daily air quality that conveys how air pollution can affect public health. The AQI is divided into six levels of health concern:

AQI Value

- Hazardous (301-500)
- Very Unhealthy (201-300)
- Unhealthy (151-200)
- Unhealthy for Sensitive Groups (101-150)
- Moderate (51-100)
- Good (0-50)
